DRAINCHECK

# How DrainCheck works

1 m terrain · 5 m analysis

Terrain, past floods and drainage scenarios.

| INPUT | METHOD | OUTPUT |
| --- | --- | --- |
| 01 TERRAIN<br>**Municipal 1 m DTM** | Rank depression fill depth on a 5 m grid. → | TERRAIN VIEW<br>**Ponding heatmap**<br>Relative signal · 0–100 |
| 02 FLOOD EVIDENCE<br>**Past floods + buildings** | Combine ponding, floods and building overlap. → | EVIDENCE VIEW<br>**Review priorities**<br>Past floods take precedence |
| 03 WHAT-IF SCENARIO<br>**Selected pipes + rain** | Reduce assumed drainage near selected pipes. → | STORM COMPARISON<br>**Baseline / clogged / change**<br>Estimated local depth + excess runoff |

Mapped water and uncertain terrain excluded; mapped greens assumed to absorb all rain.

**Comparative screening, not a calibrated flood forecast.**

Local storage estimates; no flow routing or sewer hydraulics.
